Providing 'customized solutions' for 'surface preparation' to various industries has been the objective of the company since its inception in 1976. IMEXSU INDIA has, in the last 30 years, grown and diversified its activities with the sole intention of evolving varied possible solutions to the manifold problems faced during the manufacturing, machining, fabricating, casting, extruding of components and products all under one roof.

The challenges posed by problems at various times have been the real source of inspiration for the company. These challenges have also paved the way for the company to gain an in-depth knowledge of the intricacies that go into the making of a finishing machine, equipment and components.

Problems pertaining to surfaces are different and typical in every case and hence readily available standard solutions are not always compatible. They are invariably time consuming, cumbersome and are generally not cost effective both in the initial stages as well as in the long run. Temporary solutions, found within the existing infrastructure and material, may appear less cumbersome and may even seem a necessary activity, but eventually will not be cost effective and proper, particularly if they have to be repetitively done. The initiative, effort and time spent to find a solution for such a typical problem, may apparently incur additional cost initially, but it definitely proves its worth in the long run.

We at IMEXSU INDIA have successfully provided customized solutions in a number of such typical cases, which have proved to make a sizable saving in man and machine hours.

Problems regarding surface finishing, micro deburring, deburring, micro radiusing, raduising, cleaning, you can be shared with us and we will surely come up with a solution.

We have always tried to find solutions with the use of existing setups at your end. Your CNCs, VMCs, FMCs and machining facilities support most processes required for achieving the desired result. At the most you may need a tool or a few consumables, the sequence of application and a few technical tips.

We have in house facilities required to provide trials at our end. Please feel free to come over with your 'problem' and you can be sure we will find a 'solution' to it.
